Presentation Outline

1 Introduction

- Crisp and Fuzzy Logic
- Fuzzy Sets
- 2 ApplicationsFuzzy Control
- 3 Final Remarks
 - References
 - Epilogue

Introduction to Fuzzy logic

- Fuzzy logic is an extension of Boolean logic
- Natural language rules
- Aristotle, later Lofti A. Zadeh in 1965 and 1973
- Japan, later on west

Figure 1: Lofti A. Zadeh

Fuzzy logic vs Crisp logic

Example

Carmen is 18 years old. Is she old?

Crisp¹ true/false Fuzzy true, false or the degree of *oldness*

Figure 2: The classical set theory is a subset of the theory of fuzzy sets

¹In this context referred also as a *Boolean* or *bivalent* logic

Crisp Set

Theory of Sets (formerly Classes) was conceptualized by George Cantor in 1870's.

Figure 3: Crisp set illustration. The element either is fully member of a set or is not a member at all.

Sorites Paradox [4]

When does a heap of grains stops being heap, if we are removing one grain at a time?

Figure 4: At what point exactly does blue becomes red?

Bald(0)Bald(n)
ightarrow Bald(n+1) $\therefore Bald(10000)$

Fuzzy Sets

In mathematics, fuzzy sets are sets whose elements have *degrees* of membership, described by a *membership function* [1].

- Degree of membership is defined in interval² [0, 1]
- Elements can have different degree of membership to different fuzzy sets
- If the uncertainty is not handled, we talk about type-1 fuzzy sets, type-2 otherwise

²In theory, it could be higher than 1, but in practice it is almost never used

Fuzzy Set Interpretation

How do we represent *numerical* value in a fuzzy set? With the use of *linguistic variables* [2], **not** probabilities.

Figure 5: Example interpretation of fuzzy sets. At the given temperature point, we can tell that the measured medium is "not hot", "slightly warm" and "almost cold". It does not mean that the chance the water is cold is 75%.

Definition

Let U be the *universe of discourse* and x be the element in it. The *membership function* μ_A is defined as:

$$\mu_A:X o [0,1]$$

Definition

A fuzzy set A is expressed as a set of ordered pairs, given that $\mu_A(x)$ is a degree, to which x a member of A:

$$A=\{(x,\mu_A(x))\,|\,x\in U\}$$

Standard Fuzzy Set Operations

Given that $A, B \in U$ and u is an element in universe U:

 $\begin{array}{l} \text{Complement} \ \mu_A(u) = 1 - \mu_A(u) \\ \text{Intersection} \ \mu_{A \cap B}(u) = min\{\mu_A(u), \mu_B(u)\} \\ \text{Union} \ \mu_{A \cup B}(u) = max\{\mu_A(u), \mu_B(u)\} \end{array}$

Figure 6: The complement $\mu_{\bar{A}}$, the intersection $\mu_{A\cap B}$ and the union $\mu_{A\cup B}$ (green).

Fuzzy Set Operations Truth Tables

Table 1: The truth tables for AND, OR and NOT operations

Α	В	min(A,B)
0	0	0
0	1	0
1	0	0
1	1	1

Α	В	max(A,B)		
0	0	0		
0	1	1		
1	0	1		
1	1	1		

It is no coincidence, that these truth tables for binary fuzzy sets are identical to their Boolean counterparts³.

³DeMorgan's law, associativity, comutativity and distributivity also apply.

Fuzzy logic

Triangular Norm (T-norm)

A T-norm is a **continuous** function $T:[0,1]\times [0,1] \to [0,1]$, satisfying these axioms:

Neutrality⁴ T(a, 1) = aCommutativity T(a, b) = T(b, a)Monotonicity $T(a, b) \leq T(c, d)$ if $a \leq c$ and $b \leq d$ Associativity T(a, T(b, c)) = T(T(a, b), c)

T-norm is used to customize the fuzzy **intersection** (conjunction). The fuzzy **union** (disjunction) uses the S-norm (or T-conorm).

⁴Also referred to as a *boundary condition*.

The Most Common T-norms

 $\mathsf{T}_{\min}(a,b) = \min\{a,b\}$

Figure 7: Minimum (Gödel) T-norm is the most common one

Fuzzy logic

The Most Common T-norms

 $\mathsf{T}_{\mathsf{prod}}(a,b) = a \cdot b$

Figure 8: product T-norm

Fuzzy logic

The Most Common T-norms

 $\mathsf{T}_{\mathsf{Luk}}(a,b) = max\{0, a+b-1\}$

Figure 9: Łukasiewics T-norm

Fuzzy Control

- The wider application of the fuzzy logic [3]
- Easier to mechanize tasks that are already successfully performed by humans

Figure 10: Block diagram of a fuzzy control

Fuzzy Control Applications [6]

- Camera autofocus by Canon
- Increased effectivity of Mutsushita vacuum robots
- Mitsubishi air conditioner with higher efficiency and lower sensors
- Handwriting recognition, elevator systems, self-balancing robots

The fuzzy control systems are commonly used where there are not enough resources for highly advanced systems like **PID**⁵ controller, Artificial neural network or Genetic algorithm [5].

⁵Proportional-integral-derivative
